

MicroCenter, one of the pioneer IT companies with 33 years of success in Bahrain. As a leading IT solutions company, MicroCenter has used knowledge to create smart solutions. We offer a visitor management solution that meets the core security requirements of medium and large organizations relating to visitors.

Why MicroCenter eVMS ??

In many facilities, visitors are still registered using a handwritten paper log. While this method is perceived as quick and easy, it provides virtually no security and leaves visitor information available for anyone to see. Automated visitor management solutions lend a more professional appearance, enhance security and meet compliance mandates for the collection and auditing of visitor data.

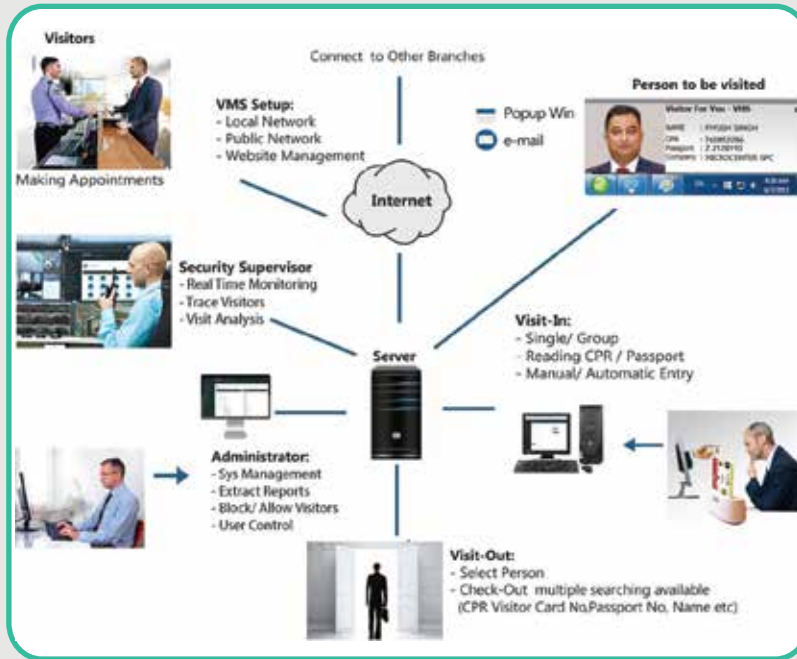

MicroCenter eVMS allows organizations to automate the entire process of registering a visitor, printing a badge and capturing detailed information in seconds by simply reading all GCC Smart IDs and all Passports.

Benefits of eVMS

- Eliminates need to manually write details of visitors in the registers
- Reduces time consumption and effort for visitors as well as security
- Prevents any incorrect information from being recorded
- Eases analysis of details by generating instant reports

The eVMS Architecture

- **Visits-in:** Reading of all GCC Smart IDs and all Passports for capturing the visitor's details and entering visits detail
- **Reports:** With all details about visitors and visits can be generated instantly
- **Data Sharing:** Data can be accessed across multiple locations, which helps to store all details of visitors in a central repository
- **Blocking:** Blocking visitor from the premises

- **Visits-out:** A page showing all current visitors and users can view the details of the checked out visitors
- **Manage Visitors:** The administrator can block or activate a particular visitor
- **Visits Details:** The user can filter the data depending on date, time, visited persons, visited locations etc. Receive notifications whenever a visitor arrives at your premises

Appointment Management

- Visitors without prior appointments can raise a request for an appointment which would be communicated to the employee.
- The secretary/receptionists to raise a request for appointment on behalf of the visitor to the staff/employee.
- The Employee can accept, cancel & postpone the appointment according to his convenience; an email for the same action will be send to the visitor at the same time.
- Appointment Reports: All Reports related to the appointments can be generated.

VMS Notification: your visitors out of the organization

 To: Ahmed

Dear Mr.Ahmed

This is auto generated notification mail from VMS, please do not reply to this mail.
 VMS sent this mail to inform you that the below visitors, who met you visited out the organization

Name/Tel	Nationality	Company
 MOHAMMED ABDULLAH 33502338	KINGDOM OF BAHRAIN	MICRO CENTER S.P.C

This email has been generated on 06 Jun 2015 03:28 pm

Notifications

- Staff/employee will receive notifications from the system via e-mail/desktop alert or SMS.
- The notifications are sent every time the security supervisor scans the visitor's CPR card at the gate.
- When the visitor exits the organization, the staff/employee receives another notification regarding the same.
- Notifications include the photograph and other necessary details of the visitor.

Fast & Secure Communication among Users

eVMS has been developed to effortlessly interface with Active Directory which makes communication among the personnel more secure & efficient due to easy accessibility to information. This characteristic allows to identify the eVMS users based on windows accounts available in Active Directory in their domain which provides Single-Sign-On (SSO). Hence, any user accessing the application site will automatically login without prompted to provide the credential.

Seamless Integration with Databases

This unique feature of eVMS enables users to access external databases like directorates, sections, employees and floors without feeding data manually.

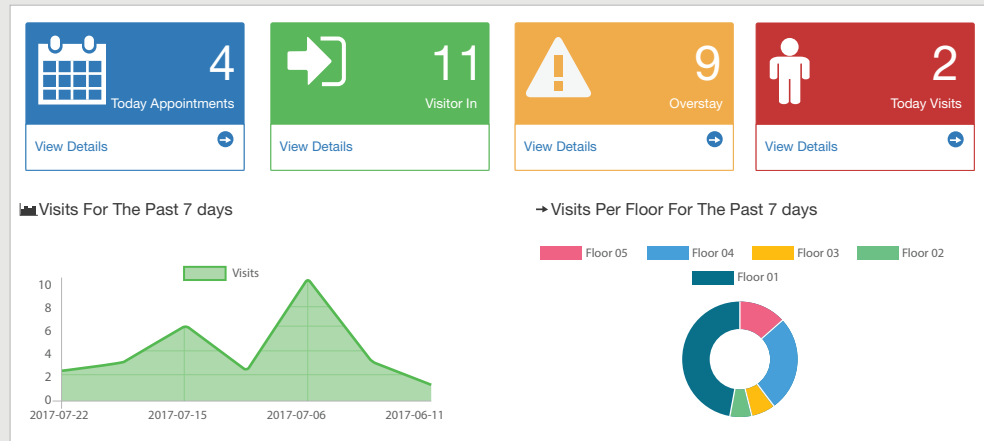

eVMS is equipped with powerful auto connection feature and feeding of required data from external databases like MS Server, My SQL and Oracle.

Better Security Intelligence

With the help of eVMS interactive dashboards, you can have holistic snapshot of all the visitors who are already inside the premises and visited in the past.

Some of the important dashboards are:

- **Today Appointments:** Display number of current accepted appointments
- **Visit In:** Display number of current visitors still inside the building
- **Overstay:** Display number of visitors exceeded the allowed time duration
- **Today Visits:** Display total number of visitors visited on current date
- **Visits** Per floors and days

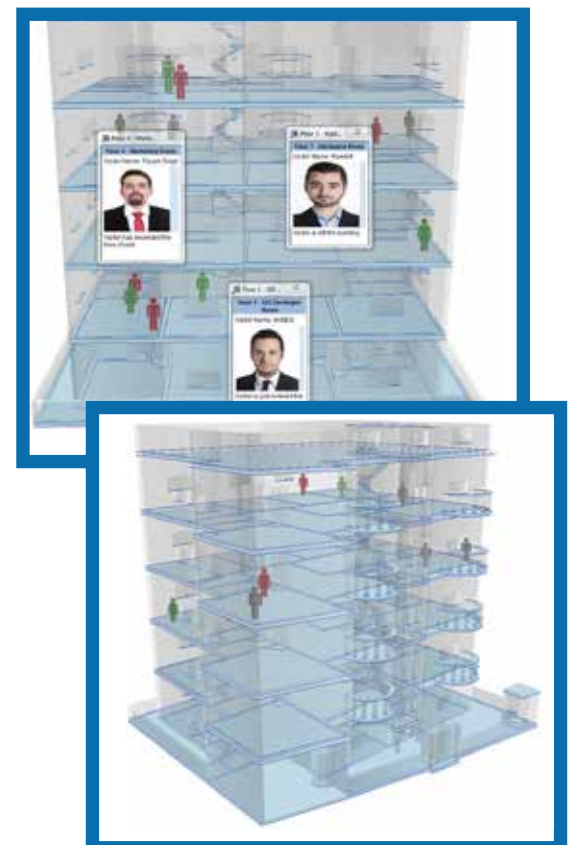

ArcGIS Integration with eVMS

eVMS is now GIS enabled by integrating with ArcGIS technology. The major objective of this integration is to facilitate the security team with visual localization and tracing of the visitor within its premises during his entire period of the stay. It would help the security team to keep a close watch on the activities of all the visitors within the premises.

The eVMS-ArcGIS integration provides the following additional features.

- ✓ Helps in creating 3D virtual buildings in line with the customer's actual building layouts. (A realistic 3D building model is also possible if the customer provides 2D architectural CAD drawings)
- ✓ Once the visitor is inside the premises, the system would help the supervisors in providing its possible location within the building with the help of color coded symbolic visitor view. The color codes change in real time based on visitor's status (visited in, visited out & overstayed) by enabling the supervisors to take instant decisions regarding unfriendly visitors.
- ✓ GIS integrated selective video streaming feature has also been enabled to assist the security supervisors to locate the visitor within the premises.

This system is different from a typical indoor tracking security systems where the visitors are tracked by attaching devices like RFID /WiFi/ GPS which can be easily removed / exchanged by the visitor himself, rendering the whole process impractical as the visitor will then be free to move about. The concept behind eVMS - ArcGIS integration is to secure the area by tracking the location of the visitor and record the details of his/her visit for future.

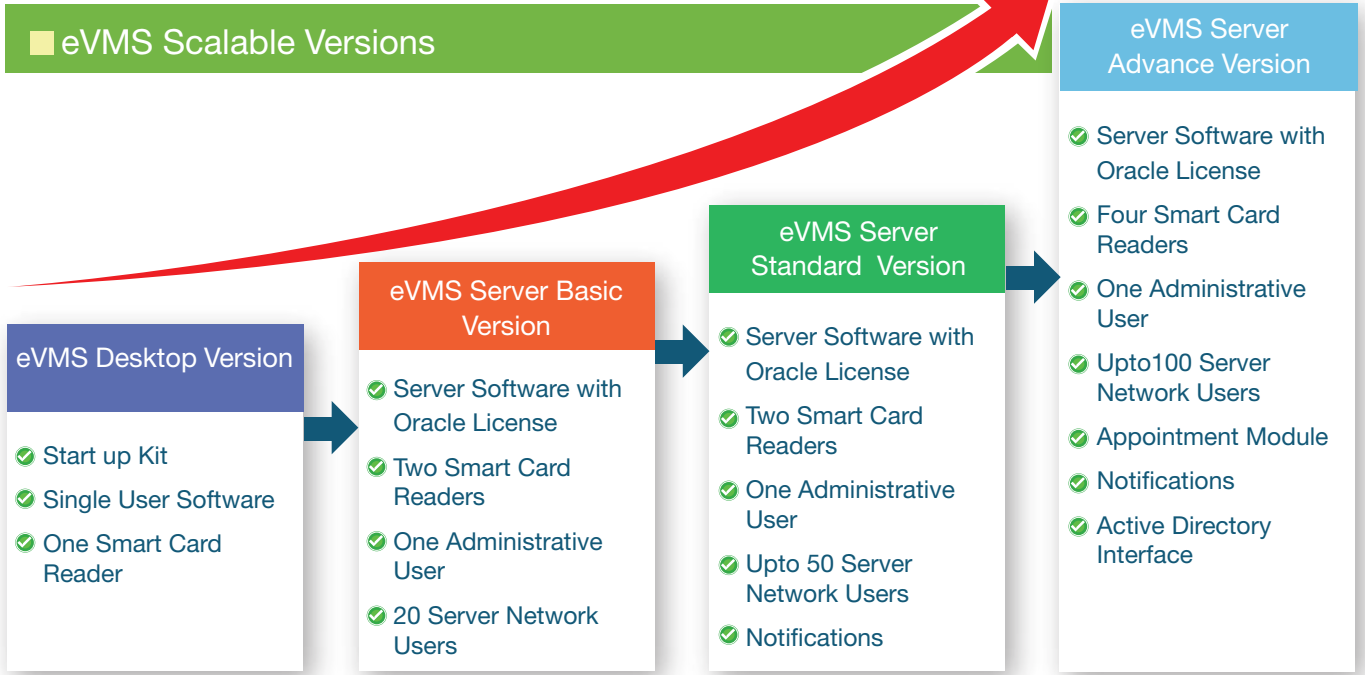

eVMS Reports

Reports:

- Daily, Weekly and Monthly visitors information Report
- Current visitors inside premises, time spent by the visitor
- Particular visitor Report, Flexible report fields
- Chart Reports, Graphical Reports, and Reports by Nationality, Departments, Floor & Division.

eVMS Scalable Versions

✿ Operating with Oracle MySQL Server
